

# 12-32 EXPANSION MODULE

The 12-32 is a 32 input expansion module that may be used either autonomously with a serial to Ethernet converter or with 12-62 transmitters. Input modules may be daisy chained together to provide as many inputs as required.

The 12-32 supports multiple message queuing, and will queue at least 50 character messages, or many more smaller messages that will fit into the available memory buffer (up to approximately 120 messages). Pre-defined input messages are limited to a maximum length of 40 characters which may be configured with programming software.
